

July 2025 CSE 216
Online on Advanced SQL
Subsection: A1+A2

Time: 50 minutes + 5 minutes(submission)

1. Find job titles in departments where employees have worked more than 5 years on average, but only include those jobs which have a maximum salary higher than the average max salary across all jobs.
2. Find employees who earn more than their department's average salary but do NOT work in departments with more than 5 employees.
3. Write a SQL query to find employees from the USA who have a manager (using EXISTS), no job_history records (using NOT EXISTS), and salary greater than their department average. Display full_name, salary, and use a CASE statement to label 'USA Star' if salary > 1.4 times department average, otherwise 'USA Above'.
4. Write an SQL query to list all departments where every employee earns more than 5000. For each department, display the department name, the number of employees in that department, and a column called Salary_Level that uses a CASE statement to show 'Above' if the department's average salary is higher than the overall company average salary, or 'Below or Equal' if it is not.
5. Write an SQL query to find employees who earn more than the highest salary of at least one other department. Only include employees whose department has at least 3 employees and who do not have any records in the JOB_HISTORY table. For each qualifying employee, display the employee ID, full name, department name, and salary.
