

July 2025 CSE 216
Online on Advanced SQL
Subsection: C1+C2

Time: 50 minutes + 5 minutes(submission)

1. Find employees earning above their department's average salary in departments with more than 4 employees.
2. Find employees who either earn more than their manager's salary or have a salary greater than their department's average salary. Print employee details with the type as either "Higher Than Manager" or "Above Dept Avg".
3. Write a SQL query for employees whose salary beats their department average and whose manager's salary beats the company average. Show full_name, salary, department_name, and label it 'Dept Top Earner' if salary > 1.5 times dept average, else 'Dept Above Avg'.
4. Find employee_id, full name, and department name of employees whose department is located in the same city as their manager's department.
5. Write an SQL query to list all departments that satisfy the following conditions:
 - (i) every employee in the department earns more than 5000,
 - (ii) the department has at least one employee with job history, and
 - (iii) the maximum salary in the department is greater than the overall company average salary.

For each such department, display the department name, number of employees, average salary, and a column called Salary_Level that shows

- 'Elite' if the department's average salary is greater than 1.5 times the company average salary,
- 'Above Average' otherwise.
